

## Fourier transform summary

<p style="text-align: center;"><b>Fourier Series</b></p> <p>The Fourier series expresses "almost any" periodic function in terms of an infinite sum of sinusoids. The time function is continuous and the sinusoids have discrete frequency values.</p> <div style="display: flex; justify-content: space-around; align-items: center;">  </div> $f(t) = \sum_{k=-\infty}^{\infty} C_k e^{jk\omega_0 t}$ $C_k = \frac{1}{T} \int_T f(t) e^{-jk\omega_0 t} dt$ <p>Continuous in time Periodic</p> <p style="text-align: right;">Discrete in frequency Not periodic</p>	<p style="text-align: center;"><b>Discrete Fourier transform</b></p> <p>The DFT is the same as the Fourier transform if both the time and frequency variables are made discrete. For the DFT both the time and frequency domains become periodic. Since all variables are discrete, the DFT is convenient for computer calculations. The fast Fourier Transform (FFT) provides an efficient algorithm for calculating the DFT.</p> <div style="display: flex; justify-content: space-around; align-items: center;">  </div> $f(nT) = \frac{1}{NT} \sum_{k=0}^{N-1} F(k) e^{j\frac{2\pi kn}{N} T}$ $F(k) = T \sum_{n=0}^{N-1} f(n) e^{-j\frac{2\pi kn}{N} T}$ <p>Discrete in time Periodic</p> <p style="text-align: right;">Discrete in frequency Periodic</p>
<p style="text-align: center;"><b>Fourier transform</b></p> <p>The Fourier transform can be derived from the Fourier series by allowing the period to go to infinity. The Fourier transform shows the frequency make up of non-periodic signals. The time function is continuous as is the frequency domain transform. If <math>C_k</math> is the value of the Fourier series coefficients for a function with period <math>T</math>, then the Fourier transform is the limit of <math>TC_k</math> as <math>T</math> goes to infinity. The Fourier transform can be "generalized" by replacing <math>j\omega</math> with the complex variable <math>s</math>. The result is the Laplace transform.</p> <div style="display: flex; justify-content: space-around; align-items: center;">  </div> $f(t) = \frac{1}{2\pi} \int_{-\infty}^{\infty} F(\omega) e^{j\omega t} d\omega$ $F(\omega) = \int_{-\infty}^{\infty} f(t) e^{-j\omega t} dt$ <p>Continuous in time Not periodic</p> <p style="text-align: right;">Continuous in frequency Not periodic</p>	<p style="text-align: center;"><b>Discrete Time Fourier transform</b></p> <p>The DTFT is the same as the Fourier transform except that the time variable is discrete. The frequency spectrum of the resulting non-periodic discrete time signal is continuous and periodic. The DTFT can be "generalized" by allowing a new complex variable, <math>z</math>, to replace <math>e^{j\omega T}</math>. This results in the z-transform.</p> <div style="display: flex; justify-content: space-around; align-items: center;">  </div> $f(nT) = \frac{1}{2\pi} \int_T F(\omega T) e^{j\omega n T} d\omega$ $F(\omega T) = T \sum_{n=-\infty}^{\infty} f(nT) e^{-j\omega n T}$ <p>Discrete in time Not periodic</p> <p style="text-align: right;">Continuous in frequency Periodic</p>
